of feeding the blend on carcass measurements. The results of these studies suggest that feeding this blend of plant extracts and acidifiers during finishing improves feed efficiency and can improve growth rate.

**178 Effects of zinc oxide and microbial phytase on standardized total tract digestibility of calcium in maize-based diets fed to growing pigs.**

L. Blavi123*, D. Solà-Oriol1, J. F. Pérez2, H. H. Stein2, 1Animal Nutrition and Welfare Service, Department of Animal and Food Sciences, Universitat Autònoma de Barcelona, Bellaterra, Spain, 2University of Illinois at Urbana-Champaign, Urbana.

It is common industry practice to use diets with pharmacological concentrations of zinc during the post-weaning period to prevent post-weaning diarrhea in pigs. However, Zn competes with Ca for absorption, and Ca and Zn may bind to phytate, which may also affect Ca absorption. Therefore, an experiment was conducted to test the hypothesis that inclusion of Zn at a therapeutic level in diets fed to pigs affects apparent total tract digestibility (ATTD) of Ca and P and standardized total tract digestibility (STTD) of Ca. The second hypothesis was that inclusion of microbial phytase increases the STTD of Ca regardless of the concentration of Zn in the diet. Fifty-six growing barrows (average BW: 15.4±1.9 kg) were allotted to a randomized complete block design with 7 dietary treatments and 8 pigs per treatment. A basal diet containing corn, cornstarch, potato protein isolate, soybean oil, calcium carbonate, monosodium phosphate, vitamins, and minerals was formulated with either 0 or 2400 mg/kg Zn from ZnO and 0, 1000, or 3000 units of phytase (FTU) per kg. A Ca-free diet was used to determine basal endogenous losses of Ca. Feces were collected from the feed provided from d 6 to 11 using the marker-to-marker approach, and urine was also collected. Retention of Ca, ATTD of Ca, and STTD of Ca increased linearly \( P < 0.01 \) as the concentration of phytase in the diet increased, but were less if ZnO was used than if no ZnO was added to the diet (interaction, \( P < 0.01 \)). Retention of P and the ATTD of P increased linearly \( P < 0.01 \) and quadratically \( P < 0.05 \) as the concentration of phytase increased in the diet, but the increase was greater if ZnO was not added than if ZnO was added to the diet (interaction, \( P < 0.05 \)). In conclusion, pharmacological levels of Zn reduced Ca and P digestibility and retention, but this effect was partly mitigated by the inclusion of high levels of phytase in the diets. Inclusion of microbial phytase increased the ATTD and STTD of Ca in diets and also the ATTD of P.

**179 Effects of increasing copper from either CuSO4 or combinations of CuSO4 and a Cu-amino acid complex on growth performance and carcass characteristics of finishing pigs.**

C. B. Carpenter1*, J. C. Woodworth1, J. M. DeRouche1, M. D. Tokach1, R. D. Goodband1, S. S. Dritz1, Z. J. Rambo2, 1Kansas State University, Manhattan, 2Zinpro Corporation, Eden Prairie, MN.

A total of 1089 pigs (PIC 280 × 1050; initially 37.3 kg) were used in a 105-d growth study to determine the effects of increasing added Cu from either CuSO4 (Prince Agri-Products, Quincy, IL) alone or a 50/50 blend of CuSO4 and Cu-AA complex (Availa®-Cu, Zinpro Corporation, Eden Prairie, MN) on growth performance and carcass characteristics of finishing pigs. Treatments were fed in 5 phases (27 to 45, 45 to 61, 61 to 77, 77 to 104, and 104 to 127 kg BW) and consisted of a control diet with 17 ppm Cu from CuSO4 from the trace mineral premix or the control plus added CuSO4 to provide 70 and 130 ppm total Cu or a 50/50 blend of CuSO4 and Cu-AA to provide 70, 100, and 130 ppm total Cu. There were 25 or 26 pigs/pen and 7 replicates/treatment. Overall, added Cu above 17 ppm did not influence ADG; however, pigs fed 70 and 130 ppm added Cu from the 50/50 blend of CuSO4 and Cu-AA had decreased \( P = 0.045 \) ADFI but G:F tended \( P = 0.051 \) to be improved compared with those fed 70 and 130 ppm of added Cu from CuSO4 only. Similar to the G:F response, pigs fed diets that contained CuSO4 alone had poorer \( P = 0.033 \) carcass G:F than those fed added Cu from the 50/50 blend of CuSO4 and Cu-AA. Carcass characteristics were not influenced. In conclusion, these data suggest pigs fed diets that contained added Cu from CuSO4 alone consume more feed but have poorer G:F on a live and carcass basis compared to those fed a 50/50 blend of CuSO4 and Cu-AA. Increasing Cu did not affect growth performance in this study.
