

4-H Beef Tagging Guidelines and Tips for EID Tags

Instructional videos for appropriate Allflex EID application may be found here:
<https://www.allflex.global/na/support/>

Applicators – for the EID tags, you **MUST** use the red **Allflex Universal Total Tagger** with the red blunt pin. *You must remove the black plastic insert from the base of the jaws.*

Placement of the EID tag in the applicator - The beef tags have a bump on the tag that is caused by the coil of wire. There is an arrow (line) on the other side of the tag. Place this to the top of the applicator when loading the tag. * See the pictures on the reverse side.

Application of the tags – As you can see in the instructions, the beef tags **MUST** be put in the **LEFT EAR** with the EID button facing to the front (inside the ear). They should be placed close to the head (1/4th to 1/3rd of the ear length) out from the base, in the middle of the ear vertically.

DO NOT put the tags in an existing hole in the ear. Doing so will greatly increase the chance of loss.
*See the pictures on the reverse side. After application, the EID tag should spin freely while the 4-H tag is held. If not, the male stem was not pushed far enough into the EID tag.

Use disinfectant to dip the tags and applicator in. It is recommended that you use a product such as Nolvasan, Vetericyn, Tek-Trol, or an iodine solution. They are effective, non-irritation products and can be purchased from the local vet or vet supply store. Using a disinfectant will help the tag site heal and provide lubrication for easier tag application. Using a product that irritates the ear (alcohol, bleach, etc.) will cause the animal to do more rubbing of the ear and increase the chance of losing the tag.

Keeping things warm – It does not matter when we schedule the steer tagging, it will be cold. Cold tags are harder to put together. Here are some ideas to keep them warm. You can keep your disinfectant in heated bucket or put the bucket of warm water inside cooler. The tags will go together easier if kept warm. If you have electricity, you can use a space heater to keep the tags in front of. If not, a cooler with plastic bottles of hot water in it can be used to keep the tags in.

Keep the matched EID tags and 4-H tags together – The tags are packaged with the EID and visual 4-H numbers matched and in a database available from Allflex USA. If for some reason the tags should get separated, you can use the sheet of labels to match them back up. Allflex has been working on their website over the past few years. If you are unable to download your tag data and need it, contact Lexie.

Using the labels – Each bag of tags has 2 sets of labels that have the EID tag, a barcode of that 15-digit number, and the visual 4-H number on it. You can use one set of labels for county tagging if you wish. You should keep one set of labels in a file to be used later for any state nominations. You should also make a copy or take a picture of the labels and put them in a safe place, in the event your labels should get damaged or misplaced.

Weigh-In Card – A template of the county weigh-in card can be downloaded from the KSU YLP website.

If the steer already has an EID tag – It is unlawful to remove an 840 tag from any specie of livestock, as it is their official (ADT) identification. An animal may also only have one EID tag. The Kansas 4-H EID tags are official 840 EID tags. Please contact Lexie if you need to tag a 4-H/FFA project with an existing EID tag. We have a process for those animals being state nominated. **DO NOT** tag an animal with an additional 840 EID tag, if they already have one – it can legally only have one.

Questions – Can be directed to Lexie Hayes, KSU Youth Livestock Program Coordinator (785)532-1264 or adhayes@ksu.edu.
